PUI HW6 Writeup
By Rich Zhu

Project Summary

For PUI final project, I decide to make my own interactive web portfolio. I plan to make it interactive by using some external libraries like Bootstrap, Materialize, Animate CSS, jQuery, etc. In terms of special effects, I will learn from some of the pages in Apple website, which means the content will be presented through special effects and certain triggers, and some pages may be entered through dragging or pulling instead of just mouse clicking. I will include a variety of visual images, videos, and interesting contents to make the website more engaging.

The portfolio will present the projects I have done in college and high school and also include information about myself, interests, past experience, and also with my resume attached. Since my interests lie in the intersection of business, technology, and design, I will convey my ideas through projects that ranges from web apps, system shells, data visualization tools, to business events I organized, and design works I made.
